PROBLEM

To predict crop yield using AI models through a user-friendly web interface based on real-time agro-environmental data.

SOLUTION

An AI-based system that predicts crop yield using agro-environmental data (rainfall, temperature, pesticides, etc.) through a simple and interactive web app for farmers and planners.

UNIQUE VALUE PROPOSITION

Accurate crop yield predictions with minimal input, empowering farmers to make data-driven decisions using a simple web interface.

UNFAIR ADVANTAGE

Combines real agro-environmental data with a trained ML model in a user-friendly app—making accurate crop yield prediction accessible without technical expertise.

CUSTOMER SEGMENTS

Farmers, agri-officers, and agri-tech users who need accurate crop yield insights for better planning.

KEY METRICS

The success of the system is measured by prediction accuracy (e.g., R^2 score), the number of active users or farmers benefiting from it, improvements in actual crop yields over time, and user engagement within the web application.

CHANNELS

We will reach users through agricultural workshops, social media awareness, collaborations with local agri-offices, and integration with government agri-portals.

EXISTING ALTERNATIVES

Traditional methods, manual estimations, and static reports with limited accuracy and no real-time prediction.

HIGH-LEVEL CONCEPT

A smart farming tool that uses AI to predict crop yield based on environmental data, delivered through an easy-to-use web app.

EARLY ADOPTERS

Tech-savvy farmers, agri-students, and government agricultural officers looking for accurate and easy-to-use crop prediction tools.

COST STRUCTURE

Major costs include cloud services for model deployment, web hosting, data acquisition, and maintenance. Additional expenses cover marketing, user support, and future model upgrades.

REVENUE STREAMS

Revenue can be generated through subscription plans, partnerships with agri-tech firms, government contracts, and offering premium features for advanced analytics.
